Revised 9 October 2013

Revision history

22 July 2013: Original report.

9 October 2013: In appendix, deleted observations of Glaucous-winged Gull on 18 Aug 1977 and 6 Sept 1977. These were determined by Bill Bousman to be invalid.

Overview

The Santa Clara Valley Audubon Society is in possession of historical, handwritten records of birds observed at Moffett Field. The records were made by Bill Bousman between September 1976 and March 1986. Observations were made on each of 189 days, distributed as shown in this figure:

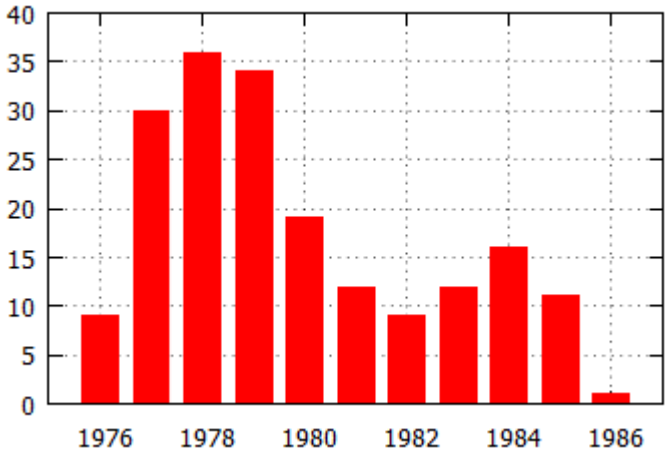

Figure 1: Observation days per year.

The SCVAS wishes to use the records in its research into the environmental impact of development at Moffett Field. To help with that effort, I took on the task of converting the handwritten records to electronic format suitable for computer analysis. This note summarizes how the task was carried out and describes the resulting database.

The database is formatted as a comma-separated text file suitable for importing into a spreadsheet or similar utility. It is available for download at http://sagedrive.com/scvas.

A printed version of the database is included in this note, as an appendix. The printout is lengthy, about twenty pages, but it is formatted to allow visual browsing. If the downloadable database becomes unavailable in the future, the entire database can be extracted from the PDF version of this note by cutting/pasting each page of the appendix into a spreadsheet or similar utility.

The database was uploaded to the public website eBird.org. The location name was chosen as "Crittenden Marsh / Moffett Field." As of the date of this note, when eBird is queried for data from

this location on any date between September 1976 and March 1986, all records returned by eBird are from this database.

Data entry

The data to be entered consists of 189 checklists spread across 54 sheets. An example sheet is shown in Fig. 2. Column headings identify a checklist by date and time, and row headings show species. Each checklist has more species than can fit on a single sheet, so groups of consecutive sheets combine to form complete checklists. The data-entry problem is to transcribe the contents of individual sheets. These are then combined into checklists by post-processing programs.

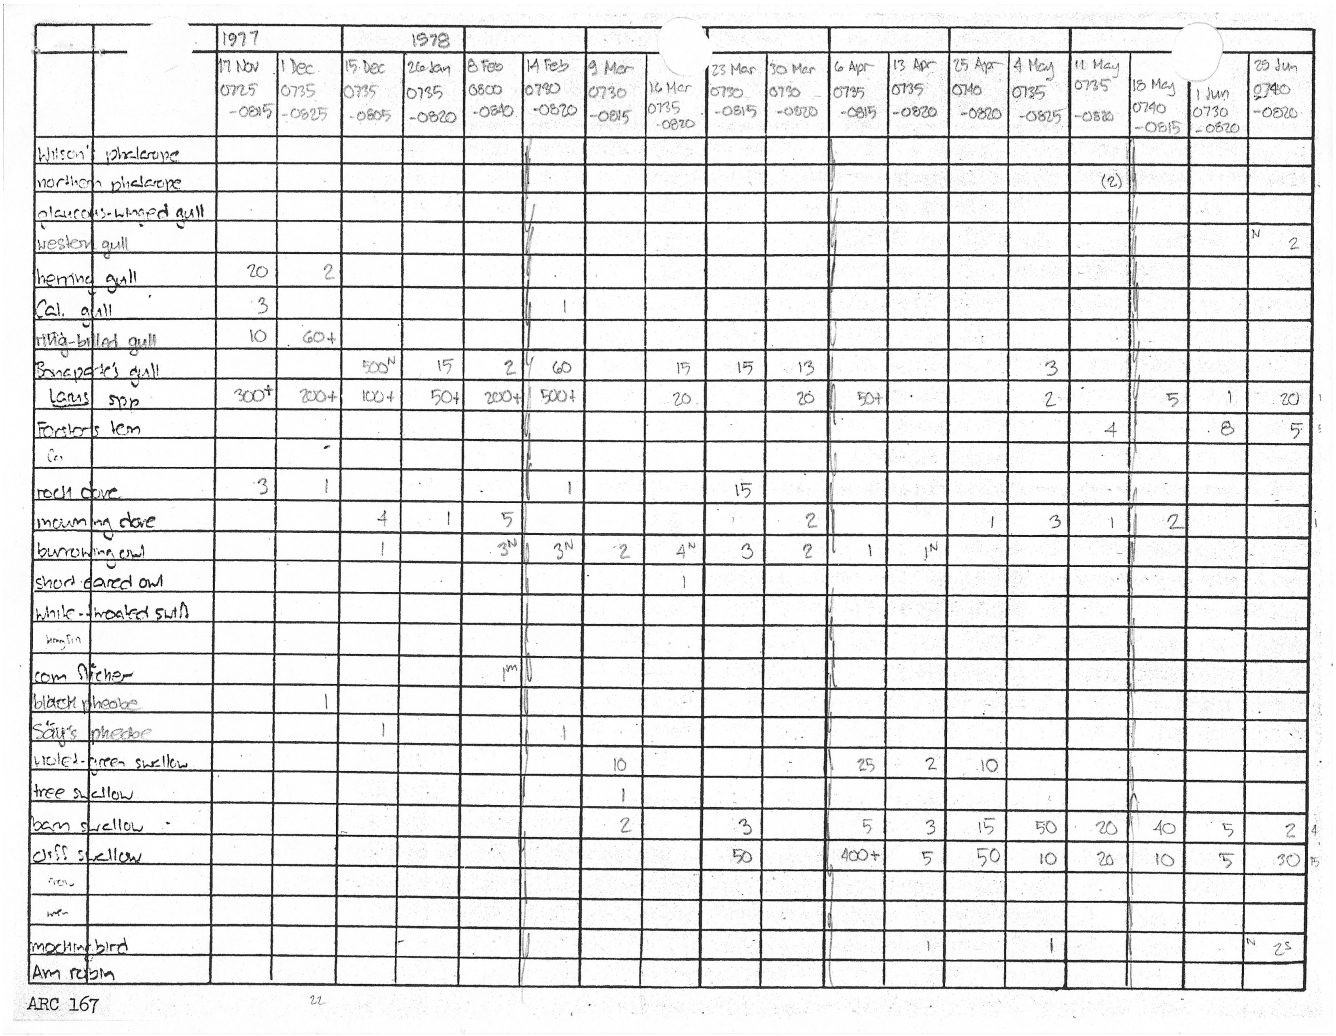

Figure 2: Example sheet. Markings were made with a pen to assist entry.

The data-entry task is laborious and error-prone. A divide-and-conquer approach was used, with the overall task broken into steps and a specific procedure developed for each step. Small programs were written to facilitate entry at each step and to assemble the final result. Once the procedure was finalized, the effort to enter the data worked out to about a half-hour per sheet, including proofreading. All programs were written in the AWK programming language, with assistance from some Unix-style utilities.

Here is a description of the steps. The file names here are simplified examples; actual names are more

formulaic.

Column headings (date and time). The 18 column headings of a sheet were manually entered into a text file "dates.in" using a text editor. Each heading is a date/time string such as "1977 17 nov 0725 0815". Since multiple sheets share the same column headings, this file was common to multiple sheets.

Row headings (species). The row headings of a sheet were entered using an interactive species-entry program. The program allowed a species name to be entered using any unambiguous abbreviation, such as "g b h" for great blue heron. The program maintained a list of recognized species. If an abbreviation was ambiguous, the user was prompted to try again. If an abbreviation did not match a recognized species, the user was given the option of adding it to the list. At the end of this process, the program produced a text file "sheetA.in" containing the row headings of the sheet. It also produced an updated list of recognized species, as a separate text file that could be edited to make adjustments. The use of this program, with its growing list of recognized species, made for rapid entry and consistent species names across all entered sheets.

Cell contents (count). This is the bulk of the entry effort. The cell contents of a sheet were entered by manually editing the file "sheetA.in" with a text editor, as follows. A row of the sheet was selected for entry. Below the corresponding species in "sheetA.in", two lines were added, as in this example:

```
burrowing owl
..x.x xxxxx xx... ...
1 3 3 2 4 3 2 1 1
```

The first line consists of 18 characters, either "x" or ".", along with spaces. The spaces are for readability only. An "x" indicates an entry in the corresponding cell; a "." indicates an empty cell. It was found that this line could be quickly and accurately entered by placing a ruler under the row and typing the two characters while visually preceding down the row. To improve accuracy, the sheet was first marked with a pen to delimit the columns into groups of 5, 5, 5, and 3, and spaces were typed as these delimiters were encountered.

The second line consists of strings separated by spaces. Each string is the entry of a cell marked by "x" in the preceding line. Again, it was found this could be accurately entered by placing a ruler under the row and typing the strings while visually proceeding down the row. In most cases, the string is a number indicating total species count. More generally, the string consists of numbers separated by non-numeric, non-space characters. This format was used because some cells reported the data in a more refined way, such as counts for male/female/juvenile, or had other notation that it was decided to include during entry. As it happens, none of these refinements are made use of in the database, and the post-processing simply strips off the non-numeric characters and adds the individual numbers to get a total count.

This manual process was performed on each species in the original "sheetA.in," until contents of all cells of the sheet have been entered.

Error checking. The entered file "sheetA.in" was processed to generate a facsimile of the original sheet for visual comparison. An example is shown in Fig. 3. The processing program itself caught some errors, such as mismatch between the number of non-empty cells in the two lines. But the bulk of the error-checking relied on the visual inspection. This was done carefully and attentively, but no doubt some errors slipped through.

There was also uncertainty in interpreting some of the cell contents. A few representative examples were discussed and resolved with Bousman, but an exhaustive review with him was not done.

Database

The database is available for download at http://sagedrive.com/scvas. It is a comma-separated text file suitable for uploading to the eBird website (as of the date of this note) or for importing into a spreadsheet or similar utility. It uses eBird's "Record Format," with each line describing the record of a single species observed on a single date. Table 1 summarizes the fields in each record.

Some of the species names needed changing in order for eBird to recognize them. A list of these is shown in Table 2.

A printed version of the database is listed in the appendix of this note. It too is comma-separated, but with a different format that is compact and readable. The format is explained at the start of the appendix. As mentioned above, if the downloadable version is not available, the user can extract the database from the PDF version of this note by importing each page of the listing into a spreadsheet or similar utility.

Field	Example	Explanation
common name	burrowing owl	In some cases the original name was changed so eBird would recognize it. See Table 2.
genus		Unused.
species		Unused.
species count	3	
species comment		Unused.
location name	Crittenden Marsh / Moffett Field	Same for all records.
latitude	37.427468	Same for all records.
longitude	-122.06416	Same for all records.
date	2/8/1978	
start time	08:00	HH:MM, 24-hour format.
state	CA	Same for all records.
country	US	Same for all records.
protocol	traveling	Same for all records.
number of observers	1	Same for all records.
duration	40	Minutes.
all observations reported?	Y	Same for all records.
distance covered	2.15	Miles. Same for all records.
area covered		Unused.
comments	Observed by Bill Bousman and entered by Mike Sabin	Same for all records.

Table 1: Fields of eBird record format.

Original	Modified
anas spp	dabbling duck sp.
black-shouldered kite	white-tailed kite
brown towhee	california towhee
common crow	american crow
common flicker	northern flicker
common moorhen	common gallinule
common snipe	wilson's snipe
dowitcher spp	short-billed/long-billed dowitcher
duck	duck sp.
european wigeon	eurasian wigeon
green-backed heron	green heron
marsh hawk	northern harrier
mockingbird	northern mockingbird
northern phalarope	red-necked phalarope
pintail	northern pintail
rock dove	rock pigeon
scaup spp	greater/lesser scaup
starling	european starling
water pipit	american pipit
white pelican	american white pelican
yellowthroat	common yellowthroat

Table 2: Species names: original, and as modified for eBird.

Appendix: Database listing

Format

For each species, the observed counts are arranged in a table. The position in the table corresponds to the date and time the observation was made. The following legend identifies date and time parameters according to position in the table.
